Primary Raw Material: Cellulose

What is Cellulose?

Cellulose is a polysaccharide composed of β -D-glucose units linked via $\beta(1\rightarrow4)$ glycosidic bonds. It is the most abundant organic polymer on Earth, constituting approximately 33% of all plant matter. Its crystalline structure lends it strength and insolubility in water and most organic solvents, which necessitates chemical modification to produce soluble derivatives.

Sources of Cellulose

The raw material for cellulose derivatives originates from various natural sources, including:

1. Wood pulp (hardwood and softwood)
2. Cotton linters
3. Bagasse (sugarcane residue)
4. Jute and other bast fibers
5. Straw and agricultural residues
6. Industrial waste products rich in cellulose

Each source offers unique characteristics, influencing the purity, fiber length, and cellulose content, which in turn impact the efficiency of derivatization processes.

Extraction and Processing of Cellulose

Purification and Isolation

The raw raw materials undergo several steps to isolate pure cellulose:

1. **Mechanical Processing:** Mechanical crushing to reduce particle size.
